The three test scenarios selected for automation in the BookStack Demo application are:

1. User Login: Testing the login functionality with valid and invalid credentials.
2. Book Management: Testing the process of creating, viewing, and editing books.
3. Search Functionality: Testing the search feature to ensure users can find relevant books.

The login functionality needs to be automated because it is one of the most frequently used features of the application. Every time a user enters the BookStack Demo app, they need to log in to their account. This task is happening during every test scenario. That is why the login feature needs to be automated.

Book management is suitable for automation because creating, viewing, and editing books involve repetitive steps. These operations need to work correctly to ensure users can handle their content without any issues. Automated tests can verify whether a book is created successfully, whether its details are displayed correctly, and whether updates are saved properly. It reduced human labor for the same task.

Search functionality needs to be automated because users frequently rely on it to find specific books, shelves, and pages. Automated tests can check whether relevant results appear for valid search keywords and whether appropriate messages are displayed when no results are found.
